1 Einleitung

2 Sequenzdiagramme

Die folgenden Sequenzdiagramme sollen den Ablauf von einzelnen Anwendungsfällen im PaVoS-System illustrieren. Die Interaktionen der Klassen miteinander in verschiedenen Situationen wird somit verdeutlicht.

2.1 Bridge

In diesem Sequenzdiagramm wird der Ablauf der Bridge beschrieben, die MQTT-Nachrichten in Records umwandelt und diese an Kafka weiterleitet. Die Bridge läuft komplett unabhängig vom restlichen System.

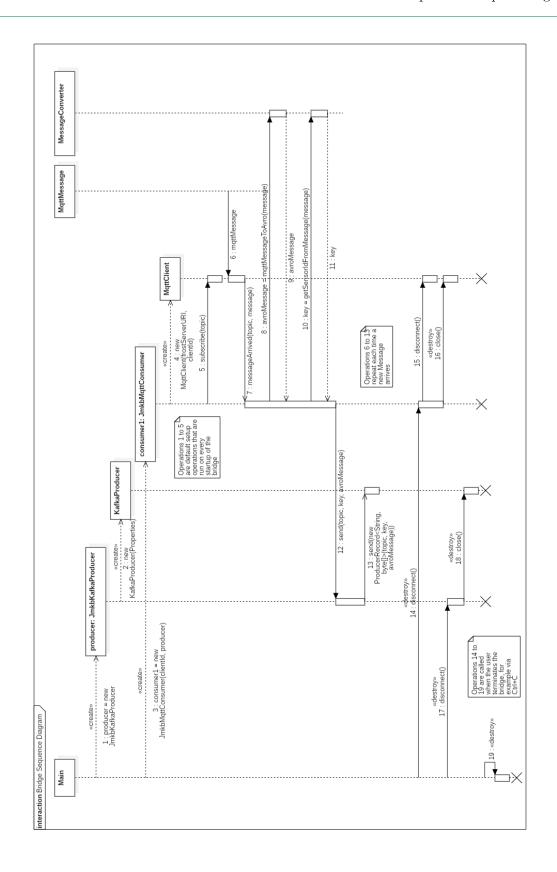

Die Bridge kann sich in einer von drei Phasen befinden:

- 1. **Aufbauphase:** Hier findet die Prüfung der Parameter und das Initialisieren der benötigten Klassen statt.
- 2. **Bereitschaftsphase:** Hier ist die Bridge bereit, Nachrichten von MQTT anzunehmen, zu konvertieren und an Kafka weiter zu senden.
- 3. **Abbauphase:** Hier werden die Verbindungen zu MQTT und Kafka getrennt, anschließend wird die Bridge beendet.

In der Aufbauphase (in diesem Diagramm Operationen 1-5) wird zunächst ein JmkbKafkaProducer erstellt, der intern einen KafkaProducer mit bestimmten Einstellungen initialisiert und eine Verbindung zum Kafka Broker aufbaut. Danach wird ein JmkbMqttConsumer erstellt, der intern einen MqttClient mit bestimmten Einstellungen initialisiert, welcher eine Verbindung zum MQTT-Server aufbaut und die Topics abonniert, die vom FROST-Server angeboten werden.

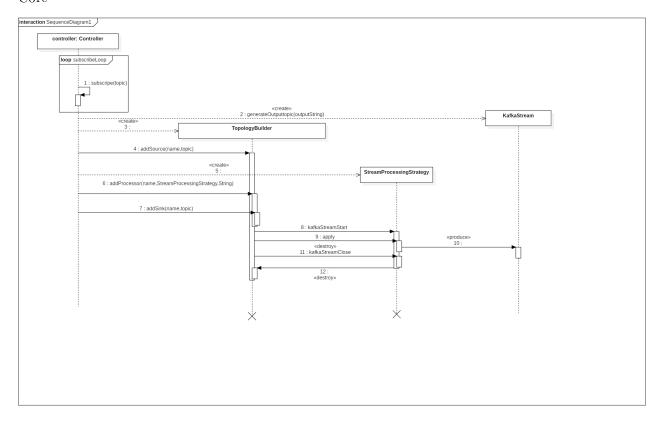

Nun beginnt die Bereitschaftsphase. Sobald eine Nachricht beim MqttClient ankommt, wird die Methode messageArrived des JmkbMqttConsumers aufgerufen. In dieser Methode wird aus der erhaltenen Nachricht die IOT-ID des Sensors gefiltert und die Nachricht wird in das Avro-Format konvertiert. Diese zwei Daten sind dann key und value für das Kafka ProducerRecord und werden über einen Aufruf der send-Methode des JmkbKafkaProducers in ein solches Format gewandelt. Anschließend wird das Record durch den KafkaProducer an Kafka gesendet.

In der Abbauphase werden die disconnect-Methoden von JmkbMqttConsumer und JmkbKafkaProducer aufgerufen, die jeweils die Verbindungen zu MQTT und Kafka sauber trennen und die Clients schließen. Die Abbauphase beginnt nur dann, wenn der Nutzer des Programms es willkürlich schließt oder das System es beendet.

3.1 Package Bridge

Package Contents	Page
Classes	
JmkbKafkaProducer	14
This class creates a Kafka producer using defined settings and publishes	
records to the Kafka Cluster.	
${f JmkbMqttConsumer}\ldots\ldots\ldots\ldots\ldots$	15
This class serves as an MqttClient that consumes messages from the specified	
FROST-Server address.	
MessageConverter	17
This convenience class provides static methods to convert a given message	
to another format.	
PropertiesFileReader	18
A class that reads properties from the configuration file (jmkb.properties)	
and provides a method for getting a property by key.	
SchemaRegistryConnector	19
Convenience class which provides methods for interacting with the schema	
registry.	

3.1.1 Class JmkbKafkaProducer

This class creates a Kafka producer using defined settings and publishes records to the Kafka Cluster.

JmkbKafkaProducer
-producer: KafkaProducer
+send(topic: String, avroMessage: byte[*]) +disconnect()

Declaration

```
public class JmkbKafkaProducer
extends java.lang.Object
```

Constructor summary

JmkbKafkaProducer() Default constructor

Method summary

disconnect() Disconnects this Kafka producer from the Kafka Cluster and closes the
 producer.
send(String, byte[]) Asynchronously sends a record to the topic.

Constructors

• JmkbKafkaProducer

```
public JmkbKafkaProducer()
```

- Description

Default constructor

Methods

• disconnect

```
public void disconnect()
```

- Description

Disconnects this Kafka producer from the Kafka Cluster and closes the producer.

send

```
public void send(java.lang.String topic, byte[] avroMessage)
```

- Description

Asynchronously sends a record to the topic.

- Parameters
 - * topic The topic.
 - * avroMessage The message to send.

3.1.2 Class JmkbMqttConsumer

This class serves as an MqttClient that consumes messages from the specified FROST-Server address. On message arrival, it will initiate the conversion of the message to a desired format via MqttMessageConverter and supply the converted message to a JmkbKafkaProducer. An instance of this class should be destroyed with a call to the disconnect() method.

Declaration

```
public class JmkbMqttConsumer
extends java.lang.Object
```

Constructor summary

JmkbMqttConsumer() Default constructor

Method summary

connectionLost(Throwable) This method is called when the connection to the server is lost

deliveryComplete(IMqttDeliveryToken) Called when delivery for a message has been completed, and all acknowledgments have been received.

disconnect() Disconnects client from MQTT and closes the client.

JmkbMqttConsumer(String, JmkbKafkaProducer) This constructor for this class. messageArrived(String, MqttMessage) This method is called when a message arrives from the server.

Constructors

• JmkbMqttConsumer

```
public JmkbMqttConsumer()
```

- Description

Default constructor

Methods

• connectionLost

public void connectionLost(java.lang.Throwable cause)

- Description

This method is called when the connection to the server is lost.

- Parameters
 - * cause the reason behind the loss of connection.

• deliveryComplete

```
public void deliveryComplete(IMqttDeliveryToken token)
```

- Description

Called when delivery for a message has been completed, and all acknowledgments have been received. In this implementation of this method, nothing happens.

- Parameters

* token - the delivery token associated with the message.

• disconnect

```
public void disconnect()
```

- Description

Disconnects client from MQTT and closes the client.

\bullet JmkbMqttConsumer

- Description

This constructor for this class. Creates a new MqttClient and subscribes to the topics specified in the SensorThings API standard. A unique identifier and a JmkbKafkaProducer should be supplied.

- Parameters

- * clientId The unique identifier for the MqttClient.
- * producer A JmkbKafkaProducer.

• messageArrived

```
public void messageArrived(java.lang.String topic, MqttMessage
    message)
```

- Description

This method is called when a message arrives from the server. This method is invoked synchronously by the MQTT client. An acknowledgment is not sent back to the server until this method returns cleanly. Any additional messages which arrive while this method is running will build up in memory, and will then back up on the network. When this method is called, the supplied message will be converted to an Avro message and forwarded to an instance of JmkbKafkaProducer, which will then send the message to the Kafka Cluster.

- Parameters

- * topic name of the topic on the message was published to
- * message the actual message.

3.1.3 Class MessageConverter

This convenience class provides static methods to convert a given message to another format.

Declaration

```
public class MessageConverter
  extends java.lang.Object
```

Constructor summary

MessageConverter() Default constructor

Method summary

getSensorIdFromMessage(byte[]) This method returns the sensor ID that has supplied the information in the message.

mqttMessageToAvro(MqttMessage) This method converts a given MqttMessage, which contains information in the JSON format, to an Avro message in a byte array.

Constructors

• MessageConverter

```
public MessageConverter()
```

- Description

Default constructor

Methods

$\bullet \ get Sensor Id From Message \\$

```
public static java.lang.String getSensorIdFromMessage(byte[] message
)
```

- Description

This method returns the sensor ID that has supplied the information in the message. In detail, this method searches for the key 'iot.id' in the message and returns the value associated with the key.

- Parameters

- * message The message from which to extract the sensor ID.
- **Returns** The sensor ID.

\bullet mqttMessageToAvro

```
public static byte[] mqttMessageToAvro(MqttMessage message)
```

- Description

This method converts a given MqttMessage, which contains information in the JSON format, to an Avro message in a byte array.

- Parameters

- * message The message to convert.
- **Returns** The message in Avro format.

3.1.4 Class PropertiesFileReader

A class that reads properties from the configuration file (jmkb.properties) and provides a method for getting a property by key.

Declaration

```
public class PropertiesFileReader
extends java.lang.Object
```

Constructor summary

PropertiesFileReader() Default constructor

Method summary

getProperty(String) Searches for the property with the specified key in jmkb.property.

Constructors

• PropertiesFileReader

```
public PropertiesFileReader()
```

- Description

Default constructor

Methods

• getProperty

```
public void getProperty(java.lang.String key)
```

- Description

Searches for the property with the specified key in jmkb.property.

- Parameters
 - * key The value associated with the key or null if the key is not found.

3.1.5 Class SchemaRegistryConnector

Convenience class which provides methods for interacting with the schema registry.

Declaration

```
public class SchemaRegistryConnector
  extends java.lang.Object
```

Constructor summary

SchemaRegistryConnector() Default constructor

Method summary

getSchemaById(int) Requests the schema associated with the schema ID from the schema registry.

getSchemaBySubject(String) Requests the latest version of the schema associated with the given subject from the schema registry.

getSchemaBySubject(String, int) Requests the given version of the schema associated with the given subject from the schema registry.

Constructors

• SchemaRegistryConnector

```
public SchemaRegistryConnector()
```

- Description

Default constructor

Methods

• getSchemaById

```
public java.lang.String getSchemaById(int id)
```

- Description

Requests the schema associated with the schema ID from the schema registry. Returns the schema if successful, null if not.

- Parameters
 - * id The schema id.
- **Returns** The schema if successful, null if not.
- \bullet getSchemaBySubject

```
public java.lang.String getSchemaBySubject(java.lang.String subject)
```

- Description

Requests the latest version of the schema associated with the given subject from the schema registry. Returns the schema if successful, null if not.

- Parameters
 - * subject The subject of the schema.
- Returns The schema if successful, null if not.

\bullet getSchemaBySubject

public java.lang.String getSchemaBySubject(java.lang.String subject,
 int version)

- Description

Requests the given version of the schema associated with the given subject from the schema registry. Returns the schema if successful, null if not.

- Parameters

- * subject The subject of the schema.
- * version The schema version.
- **Returns** the schema if successful, null if not.

Class Hierarchy

Classes

- java.lang.Object
 - Import.CSVReaderStrategy (in 3.2.2, page 23)
 - Import.DataImporter (in 3.2.3, page 25)
 - Import.FileImporter (in 3.2.4, page 25)
 - Import.FrostSender (in 3.2.5, page 26)
 - Import.NetCDFReaderStrategy (in 3.2.6, page 27)
 - \bullet Import.ReaderType (in 3.2.7, page 29)

Interfaces

• Import.FileReaderStrategy (in 3.2.1, page 22)

3.2 Package Import

Package Contents	Page
Interfaces	
FileReaderStrategy	22
Interface for the FileReaderStrategy classes.	
Classes	
CSVReaderStrategy	23
Implementation of the FileReaderStrategy interface for CSV files.	
DataImporter	25
Importer for data that should be added to PaVoS.	
FileImporter	25
Importer for the Data contained in a File.	
FrostSender	26
sends Data to the FROST-Server.	
NetCDFReaderStrategy	27
Implementation of the FileReaderStrategy interface for NetCDF files.	
$egin{array}{cccccccccccccccccccccccccccccccccccc$	29
Is like a chooser for the right FileReaderStrategy.	

3.2.1 Interface FileReaderStrategy

Interface for the FileReaderStrategy classes. Realization of a Strategy to be able to swap out the way a File has to be read.

Declaration

public interface FileReaderStrategy

All known subinterfaces

NetCDFReaderStrategy (in 3.2.6, page 27), CSVReaderStrategy (in 3.2.2, page 23)

All classes known to implement interface

NetCDFReaderStrategy (in 3.2.6, page 27), CSVReaderStrategy (in 3.2.2, page 23)

Method summary

sendFileData(FilePath, FrostSender) Reades from a File as specified by the File-Path and sends the information in it to the FROST-Server using the FrostSender that was provided.

Methods

• sendFileData

void sendFileData (FilePath path, FrostSender froster)

- Description

Reades from a File as specified by the FilePath and sends the information in it to the FROST-Server using the FrostSender that was provided.

- Parameters
 - * path Is the FilePath of the File to Import.
 - * froster Is the FrostSender instance that will be used to send the files data to the Frost-Server.

3.2.2 Class CSVReaderStrategy

Implementation of the FileReaderStrategy interface for CSV files.

Declaration

```
public class CSVReaderStrategy
  extends java.lang.Object implements FileReaderStrategy
```

Constructor summary

CSVReaderStrategy() Default constructor

Method summary

sendFileData(FilePath, FrostSender) Reades from a File as specified by the File-Path and sends the information in it to the FROST-Server using the FrostSender that was provided.

sendFileData(FilePath, FrostSender) Reades from a File as specified by the File-Path and sends the information in it to the FROST-Server using the FrostSender that was provided.

Constructors

• CSVReaderStrategy

```
public CSVReaderStrategy()
```

- Description

Default constructor

Methods

• sendFileData

```
public void sendFileData (FilePath path, FrostSender froster)
```

- Description

Reades from a File as specified by the FilePath and sends the information in it to the FROST-Server using the FrostSender that was provided.

- Parameters
 - * path Is the FilePath of the File to Import.
 - * froster Is the FrostSender instance that will be used to send the files data to the Frost-Server.
- sendFileData

```
public void sendFileData (FilePath path, FrostSender froster)
```

- Description

Reades from a File as specified by the FilePath and sends the information in it to the FROST-Server using the FrostSender that was provided.

- Parameters
 - * path Is the FilePath of the File to Import.
 - * froster Is the FrostSender instance that will be used to send the files data to the Frost-Server.

3.2.3 Class DataImporter

Importer for data that should be added to PaVoS. Import takes place for files in a specified folder of the server.

Declaration

```
public class DataImporter
extends java.lang.Object
```

Constructor summary

DataImporter() Default constructor

Method summary

startImportingFileData() Checks for files in the specified import folder and opens a new thread for each of them, where a FileImporter is started to import the contained data.

Constructors

• DataImporter

```
public DataImporter()
```

- Description

Default constructor

Methods

 \bullet startImportingFileData

```
public void startImportingFileData()
```

- Description

Checks for files in the specified import folder and opens a new thread for each of them, where a FileImporter is started to import the contained data.

3.2.4 Class FileImporter

Importer for the Data contained in a File. Takes the Data and sends them to the FROST-Server.

Declaration

```
public class FileImporter
extends java.lang.Object
```

Constructor summary

FileImporter() Default constructor

Method summary

addFileData(FilePath, FrostSender) Adds the Data of a File at a specified FilePath to the FROST-Server.

Constructors

• FileImporter

```
public FileImporter()
```

- Description

Default constructor

Methods

• addFileData

```
public void addFileData (FilePath path, FrostSender froster)
```

- Description

Adds the Data of a File at a specified FilePath to the FROST-Server. To do so, the FileExtension of the File is determined. With help of the readerTypeClass the matching implementation of the FileReaderStrategy interface for the FileExtension is generated and can be used to get the Data from then File.

- Parameters
 - * path Is the FilePath of the File to Import.
 - * froster Is the FrostSender instance that will be used to send the files data to the Frost-Server.

3.2.5 Class FrostSender

sends Data to the FROST-Server.

Declaration

```
public class FrostSender
extends java.lang.Object
```

Constructor summary

FrostSender() Default constructor

Method summary

sendToFrostServer(JsonObject) Sends the given JsonObject to the FROST-Server.

Constructors

• FrostSender

```
public FrostSender()
```

- Description

Default constructor

Methods

 \bullet sendToFrostServer

```
public void sendToFrostServer(JsonObject json)
```

- Description

Sends the given JsonObject to the FROST-Server.

- Parameters
 - * json Represents a single ObservedProperty.

3.2.6 Class NetCDFReaderStrategy

Implementation of the FileReaderStrategy interface for NetCDF files.

Declaration

```
public class NetCDFReaderStrategy
  extends java.lang.Object implements FileReaderStrategy
```

Constructor summary

NetCDFReaderStrategy() Default constructor

Method summary

sendFileData(FilePath, FrostSender) Reades from a File as specified by the File-Path and sends the information in it to the FROST-Server using the FrostSender that was provided.

sendFileData(FilePath, FrostSender) Reades from a File as specified by the File-Path and sends the information in it to the FROST-Server using the FrostSender that was provided.

Constructors

• NetCDFReaderStrategy

```
public NetCDFReaderStrategy()
```

- Description

Default constructor

Methods

• sendFileData

```
public void sendFileData (FilePath path, FrostSender froster)
```

- Description

Reades from a File as specified by the FilePath and sends the information in it to the FROST-Server using the FrostSender that was provided.

- Parameters
 - * path Is the FilePath of the File to Import.
 - * froster Is the FrostSender instance that will be used to send the files data to the Frost-Server.
- sendFileData

```
public void sendFileData (FilePath path, FrostSender froster)
```

- Description

Reades from a File as specified by the FilePath and sends the information in it to the FROST-Server using the FrostSender that was provided.

- Parameters
 - * path Is the FilePath of the File to Import.
 - * froster Is the FrostSender instance that will be used to send the files data to the Frost-Server.

3.2.7 Class ReaderType

Is like a chooser for the right FileReaderStrategy. If a new Strategy is added, this class needs some changes to use the new Strategy.

Declaration

```
public class ReaderType
  extends java.lang.Object
```

Constructor summary

ReaderType() Default constructor

Method summary

getFileReaderForFileExtension(FileExtension) Gives a new Instance of a FileReaderStrategy for the specified FileExtension.

Constructors

• ReaderType

```
public ReaderType()
```

- Description

Default constructor

Methods

 $\bullet \ getFileReaderForFileExtension \\$

```
public static FileReaderStrategy getFileReaderForFileExtension(
    FileExtension extension)
```

- Description

Gives a new Instance of a FileReaderStrategy for the specified FileExtension.

- Parameters
 - $*\ {\tt extension-is\ the\ FileExtension\ for\ which\ a\ FileReaderStrategy\ has\ to\ be\ generated}.$
- Returns An instance of an implementation of the FileReaderStrategy interface.

Class Hierarchy

Classes

• java.lang.Object
• DatabaseConnection.ClusterID (in 3.3.1, page 31)
• DatabaseConnection.Facade (in 3.3.3, page 32)
• DatabaseConnection.HttpServlet (in 3.3.5, page 35)
• DatabaseConnection.GridDataServlet (in 3.3.4, page 34)
• DatabaseConnection.SensorListServlet (in 3.3.9, page 38)
• DatabaseConnection.KafkaToStorageProcessor (in 3.3.6, page 36)
• DatabaseConnection.Maintainer (in 3.3.7, page 37)

- DatabaseConnection.DataMaintainer (in 3.3.2, page 31)
 - DatabaseConnection.SensorMaintainer (in 3.3.10, page 39)
- ullet DatabaseConnection.MaintenanceManager (in 3.3.8, page 37)
- $\bullet \ Database Connection. Zoom Level \ {\tiny (in \ 3.3.11, \ page \ 40)}$

3.3 Package DatabaseConnection

Package Contents Po	age
Classes	
ClusterID	. 31
This class describes a unique identification of a cluster via longitude and	
latitude.	
DataMaintainer	.31
This class maintains the sensordata in the StorageSolution.	
Facade	. 32
A facade to simplify access to a StorageSolution, such as a database.	
${\bf Grid Data Servlet} \dots \dots$. 34
An HTTPServlet for requesting Grid data.	
HttpServlet	. 35
An abstract HTTPServlet.	
KafkaToStorageProcessor	.36
This class converts KafkaStream records to data that can be inserted into	
the StorageSolution.	
Maintainer	. 37
An abstract class describing a Maintainer, which performs maintenance on	
certain data in the StorageSolution.	
MaintenanceManager	. 37
This class manages the way the methods of Maintainers are called to make	
sure the StorageSolution content is maintained.	
SensorListServlet	. 38
An HTTPServlet for requesting a list of sensors.	

SensorMaintainer
This class maintains the list of sensors saved in the StorageSolution.
ZoomLevel
This class describes a zoom level for the map.

3.3.1 Class ClusterID

This class describes a unique identification of a cluster via longitude and latitude.

Declaration

```
public class ClusterID
  extends java.lang.Object
```

Constructor summary

ClusterID() Default constructor

Constructors

• ClusterID

```
public ClusterID()
```

- Description

Default constructor

3.3.2 Class DataMaintainer

This class maintains the sensordata in the StorageSolution.

Declaration

```
public class DataMaintainer
extends DatabaseConnection.Maintainer
```

Constructor summary

DataMaintainer() Default constructor

Method summary

summarize(TimeUnit) This method takes data of a certain TimeUnit and summarizes it into the next higher TimeUnit.

Constructors

• DataMaintainer

```
public DataMaintainer()
```

- Description

Default constructor

Methods

• summarize

```
public void summarize(TimeUnit timeUnit)
```

- Description

This method takes data of a certain TimeUnit and summarizes it into the next higher TimeUnit. The summarized data is then saved back into the StorageSolution. The original data of the lower TimeUnit is then deleted from the database.

- Parameters
 - * timeUnit The TimeUnit to summarize.

3.3.3 Class Facade

A facade to simplify access to a StorageSolution, such as a database. Through the methods, data can be inserted into the StorageSolution and certain information about its content requested.

Declaration

```
public class Facade
  extends java.lang.Object
```

Constructor summary

Facade() Default constructor

Method summary

getGrid(ClusterID[], ZoomLevel, Time) Returns an appropriate grid of clusters in the requested grid section for the specified ZoomLevel and time.

getSensors(ObservationType, ClusterID) Fetches all sensors from the given cluster that observe the given ObservedProperty and returns an array of sensors.

subscribe To Zoom Level Stream (KStream) Subscribes to the given Kafka Stream, which contains Zoom Level-specific data and initiates processing of its records.

Constructors

• Facade

```
public Facade()
```

- Description

Default constructor

Methods

• getGrid

public Grid getGrid(ClusterID[] clusters, ZoomLevel zoom, Time time)

- Description

Returns an appropriate grid of clusters in the requested grid section for the specified ZoomLevel and time. The (first) two values of the ClusterID array define the grid section from which to get the data.

- Parameters

- * clusters An array of ClusterIDs from which the first two entries are taken to compute the section of the Grid to get the data from.
- * zoom The ZoomLevel from which to get the data.
- * time The point in time.
- **Returns** A grid with the computed data.

• getSensors

```
public java.util.Set getSensors(ObservationType type, ClusterID id)
```

- Description

Fetches all sensors from the given cluster that observe the given ObservedProperty and returns an array of sensors.

- Parameters

- * type The ObservationType of the requested sensors.
- * id The ID of the cluster.
- Returns An array of sensors.

ullet subscribe To Zoom Level Stream

public void subscribeToZoomLevelStream (KStream stream)

- Description

Subscribes to the given KafkaStream, which contains ZoomLevel-specific data and initiates processing of its records.

- Parameters

* stream - The stream to subscribe to.

3.3.4 Class GridDataServlet

An HTTPServlet for requesting Grid data.

Declaration

```
public class GridDataServlet
  extends DatabaseConnection.HttpServlet
```

Constructor summary

GridDataServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) This method calls the getGrid method of the Facade to get a Grid of clusters at a certain ZoomLevel and Time.

Constructors

• GridDataServlet

```
public GridDataServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

This method calls the getGrid method of the Facade to get a Grid of clusters at a certain ZoomLevel and Time . This saves the Grid into res.

- Parameters

- * req An HttpServletRequest object that contains the request the client has made of the servlet.
- * res An HttpServletResponse object that contains the response the servlet sends to the client.

Members inherited from class HttpServlet

 ${\tt DatabaseConnection.HttpServlet} \ \ ({\rm in} \ 3.3.5, \ {\rm page} \ 35)$

• public void doGet(HttpServletRequest req, HttpServletResponse res)

3.3.5 Class HttpServlet

An abstract HTTPServlet.

Declaration

```
public class HttpServlet
  extends java.lang.Object
```

All known subclasses

SensorListServlet (in 3.3.9, page 38), GridDataServlet (in 3.3.4, page 34)

Constructor summary

HttpServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) Called by the server (via the service method) to allow a servlet to handle a GET request.

Constructors

• HttpServlet

```
public HttpServlet()
```

- Description

Default constructor

Methods

• doGet

public void doGet(HttpServletRequest req, HttpServletResponse res)

- Description

Called by the server (via the service method) to allow a servlet to handle a GET request.

- Parameters
 - * req An HttpServletRequest object that contains the request the client has made of the servlet.
 - * res An HttpServletResponse object that contains the response the servlet sends to the client.

3.3.6 Class KafkaToStorageProcessor

This class converts KafkaStream records to data that can be inserted into the StorageSolution.

Declaration

```
public class KafkaToStorageProcessor
extends java.lang.Object
```

Constructor summary

KafkaToStorageProcessor() Default constructor

Method summary

subscribe(KStream) Subscribes to the given KafkaStream and converts the data to the appropriate format for the StorageSolution.

Constructors

• KafkaToStorageProcessor

```
public KafkaToStorageProcessor()
```

- Description

Default constructor

Methods

• subscribe

```
public void subscribe(KStream stream)
```

- Description

Subscribes to the given KafkaStream and converts the data to the appropriate format for the StorageSolution. If a stream is already subscribed to, unsubscribes from the old stream and subscribes to the new one.

- Parameters

* stream - The KStream to subscribe to.

3.3.7 Class Maintainer

An abstract class describing a Maintainer, which performs maintenance on certain data in the StorageSolution.

Declaration

```
public class Maintainer
extends java.lang.Object
```

All known subclasses

SensorMaintainer (in 3.3.10, page 39), DataMaintainer (in 3.3.2, page 31)

Constructor summary

Maintainer() Default constructor

Constructors

• Maintainer

```
public Maintainer()
```

- Description

Default constructor

3.3.8 Class MaintenanceManager

This class manages the way the methods of Maintainers are called to make sure the StorageSolution content is maintained.

Declaration

```
public class MaintenanceManager
extends java.lang.Object
```

Constructor summary

MaintenanceManager() Default constructor

Method summary

startMaintenance() This method should be called as soon as the database is started.

Constructors

• MaintenanceManager

```
public MaintenanceManager()
```

- Description

Default constructor

Methods

• startMaintenance

```
public void startMaintenance()
```

- Description

This method should be called as soon as the database is started. Through calls to instances of Maintainers, summarizes data in the database and deletes data that has become obsolete as a result of the summarization.

3.3.9 Class SensorListServlet

An HTTPServlet for requesting a list of sensors.

Declaration

```
public class SensorListServlet
extends DatabaseConnection.HttpServlet
```

Constructor summary

SensorListServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) This method calls the getSensors method of the Facade to get a list of Sensors that are in a certain cluster.

Constructors

• SensorListServlet

```
public SensorListServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

This method calls the getSensors method of the Facade to get a list of Sensors that are in a certain cluster.

- Parameters
 - * req An HttpServletRequest object that contains the request the client has made of the servlet.
 - * res An HttpServletResponse object that contains the response the servlet sends to the client.

Members inherited from class HttpServlet

DatabaseConnection.HttpServlet (in 3.3.5, page 35)

ullet public void $doGet(\mbox{HttpServletRequest req}, \mbox{HttpServletResponse res})$

3.3.10 Class SensorMaintainer

This class maintains the list of sensors saved in the StorageSolution.

Declaration

```
public class SensorMaintainer
extends DatabaseConnection.Maintainer
```

Constructor summary

SensorMaintainer() Default constructor

Method summary

checkSensorsOfCluster(ClusterID) This method checks if the sensors registered to the given cluster are up to date.

Constructors

• SensorMaintainer

```
public SensorMaintainer()
```

- Description

Default constructor

Methods

• checkSensorsOfCluster

```
public void checkSensorsOfCluster(ClusterID cluster)
```

- Description

This method checks if the sensors registered to the given cluster are up to date. A sensor is up to date if data has been received from it in the last 24 hours. If this requirement is not met, the sensor is deleted from the database.

- Parameters
 - * cluster The cluster to check.

3.3.11 Class ZoomLevel

This class describes a zoom level for the map.

Declaration

public class ZoomLevel
 extends java.lang.Object

Constructor summary

ZoomLevel() Default constructor

Constructors

• ZoomLevel

public ZoomLevel()

- Description

Default constructor

Class Hierarchy

Interfaces

• Export.FileWriterStrategy (in 3.4.1, page 43)

3.4 Package Export

Package Contents	Page
Interfaces	
FileWriterStrategy	43
Interface for the FileWriterStrategy classes.	
Classes	
AbstractExporter	44
Abstract Exporter of Data to a File.	
CSVWriterStrategy	45
Implementation of the FileWriterStrategy interface for CSV files.	
ExportProperties	46
Contains the Properties of an Export Request.	
${f Export Stream Generator} \dots \dots$	48

Generates a Stream for the Export by asking for one at the PaVoS Core and
Subscribing to it.
FileExporter
Exporter of Data from Kafka to a File.
FileExtension
Represents the FileExtension of a File.
FileType51
Is used to store a FileExtension information and give the right FileWriter for
this FileExtension.
FileTypesUtility52
Utility class that provides static methods to get all supported FileExtensions
and one to get a new Instance of the FileWriter associated with a given
${ m File Extension}.$
NetCDFWriterStrategy53
Implementation of the FileWriterStrategy interface for NetCDF files.

3.4.1 Interface FileWriterStrategy

Interface for the FileWriterStrategy classes. Realization of a Strategy to be able to swap out the way a File has to be saved.

Declaration

public interface FileWriterStrategy

All known subinterfaces

NetCDFWriterStrategy (in 3.4.10, page 53), CSVWriterStrategy (in 3.4.3, page 45)

All classes known to implement interface

NetCDFWriterStrategy (in 3.4.10, page 53), CSVWriterStrategy (in 3.4.3, page 45)

Method summary

saveToFile(KStream, FilePath) Creates a File as specified by the FilePath and saves the Data from the provided KafkaStream into it.

Methods

• saveToFile

void saveToFile (KStream stream, FilePath path)

- Description

Creates a File as specified by the FilePath and saves the Data from the provided Kafka-Stream into it.

- Parameters

- * stream is the KStream, that should be exported to a File.
- * path Is the FilePath, where the new File should be created.

3.4.2 Class AbstractExporter

Abstract Exporter of Data to a File.

Declaration

```
public class AbstractExporter
extends java.lang.Object
```

All known subclasses

FileExporter (in 3.4.6, page 49)

Field summary

properties Contains the Properties of an Export Request.

Constructor summary

AbstractExporter() Default constructor

Method summary

```
createFile() Generates the File with the desired Data.
createFileInformation() Creates Information for that Export.
```

Fields

- public ExportProperties properties
 - Contains the Properties of an Export Request.

Constructors

• AbstractExporter

```
public AbstractExporter()
```

- Description

Default constructor

Methods

• createFile

```
public void createFile()
```

- Description

Generates the File with the desired Data.

• createFileInformation

```
public DownloadID createFileInformation()
```

- Description

Creates Information for that Export. These Information will be used to identifie a File for the WebGUI, that gets the created DownloadID.

- **Returns** - Is the DownloadID for the started Export.

3.4.3 Class CSVWriterStrategy

Implementation of the FileWriterStrategy interface for CSV files.

Declaration

```
public class CSVWriterStrategy
extends java.lang.Object implements FileWriterStrategy
```

Constructor summary

CSVWriterStrategy() Default constructor

Method summary

saveToFile(KStream, FilePath) Creates a File as specified by the FilePath and saves the Data from the provided KafkaStream into it.

saveToFile(KStream, FilePath) Creates a File as specified by the FilePath and saves the Data from the provided KafkaStream into it.

Constructors

• CSVWriterStrategy

```
public CSVWriterStrategy()
```

- Description

Default constructor

Methods

• saveToFile

```
public void saveToFile(KStream stream, FilePath path)
```

- Description

Creates a File as specified by the FilePath and saves the Data from the provided Kafka-Stream into it.

- Parameters

- * stream is the KStream, that should be exported to a File.
- * path Is the FilePath, where the new File should be created.

• saveToFile

```
public void saveToFile(KStream stream, FilePath path)
```

- Description

Creates a File as specified by the FilePath and saves the Data from the provided Kafka-Stream into it.

- Parameters

- * stream is the KStream, that should be exported to a File.
- * path Is the FilePath, where the new File should be created.

3.4.4 Class ExportProperties

Contains the Properties of an Export Request.

Declaration

```
public class ExportProperties
  extends java.lang.Object
```

Constructor summary

ExportProperties() Default constructor

Method summary

```
getClusters() Get the ClusterIDs that should be exported.
getFileExtension() Get the FileExtension for the Export File.
getObservedProperties() Get the ObsorvedProperties that should be exported.
getSensorIDs() Get the SensorIDs that should be exported.
getTimeFrame() Get the TimeFrame of the Data that should be exported.
```

Constructors

• ExportProperties

```
public ExportProperties()
```

- Description

Default constructor

Methods

• getClusters

```
public java.util.Set getClusters()
```

- Description

Get the ClusterIDs that should be exported. Always only exports a Groupd of Sensors or a Group of Clusters. The other Option is Empty.

- **Returns** The Clusters that should be taken in the Export.
- getFileExtension

```
public FileExtension getFileExtension()
```

- Description

Get the FileExtension for the Export File.

- **Returns** - The FileExtension for the File to export.

• getObservedProperties

```
public java.util.Set getObservedProperties()
```

- Description

Get the ObsorvedProperties that should be exported.

- Returns - The ObservedProperties that should be used for the export.

• getSensorIDs

```
public java.util.Set getSensorIDs()
```

- Description

Get the SensorIDs that should be exported. Always only exports a Groupd of Sensors or a Group of Clusters. The other Option is Empty.

- **Returns** - The SensorIDs of the Data that should be exported.

• getTimeFrame

```
public TimeFrame getTimeFrame()
```

- Description

Get the TimeFrame of the Data that should be exported.

- **Returns** - The TimeFrame of the Data to be exported.

3.4.5 Class ExportStreamGenerator

Generates a Stream for the Export by asking for one at the PaVoS Core and Subscribing to it.

Declaration

```
public class ExportStreamGenerator
  extends java.lang.Object
```

Field summary

properties Contains the Properties of an Export Request.

Constructor summary

ExportStreamGenerator() Default constructor

Method summary

createExportStream() Asks for a KafkaStream and subscribes to it.

Fields

- public ExportProperties properties
 - Contains the Properties of an Export Request.

Constructors

 $\bullet \ ExportStreamGenerator \\$

```
public ExportStreamGenerator()
```

- Description

Default constructor

Methods

• createExportStream

```
public KStream createExportStream()
```

- Description

Asks for a KafkaStream and subscribes to it. Then gives it through to the needed part for the export.

- **Returns** - Is a KStream of the Data that should be exported.

3.4.6 Class FileExporter

Exporter of Data from Kafka to a File.

Declaration

```
public class FileExporter
extends Export . AbstractExporter
```

Constructor summary

FileExporter() Default constructor

Method summary

```
createFile() Generates the File with the desired Data.
createFileInformation() Creates Information for that Export.
```

Constructors

• FileExporter

```
public FileExporter()
```

- Description

Default constructor

Methods

• createFile

```
public void createFile()
```

- Description

Generates the File with the desired Data.

• createFileInformation

```
public DownloadID createFileInformation()
```

- Description

Creates Information for that Export. These Information will be used to identifie a File for the WebGUI, that gets the created DownloadID.

- **Returns** - Is the DownloadID for the started Export.

Members inherited from class AbstractExporter

 ${\tt Export.AbstractExporter} \ ({\rm in} \ 3.4.2, \ {\rm page} \ 44)$

- public void createFile()
- public DownloadID createFileInformation()
- public properties

3.4.7 Class FileExtension

Represents the FileExtension of a File. Is used to match the right FileFormat for an export or import.

Declaration

```
public class FileExtension
extends java.lang.Object
```

Constructor summary

FileExtension() Default constructor

Constructors

• FileExtension

```
public FileExtension()
```

- Description

Default constructor

3.4.8 Class FileType

Is used to store a FileExtension information and give the right FileWriter for this FileExtension.

Declaration

```
public class FileType
extends java.lang.Object
```

Field summary

extension The FileExtension is defining the FileType.

Constructor summary

```
FileType() Default constructor
```

Method summary

getFileWriter() Gives an instance of the implemented FileWriter that is associated with this FileType, thus this FileExtension.

Fields

- public FileExtension extension
 - The FileExtension is defining the FileType.

Constructors

• FileType

```
public FileType()
```

- Description

Default constructor

Methods

• getFileWriter

```
public FileWriterStrategy getFileWriter()
```

- Description

Gives an instance of the implemented FileWriter that is associated with this FileType, thus this FileExtension. To do so it uses the static method getFileWriterForFileExtension from the FileTypesUtility class.

- **Returns** - Is a new instance of an implementation of a FilWriterStrategy.

3.4.9 Class FileTypesUtility

Utility class that provides static methods to get all supported FileExtensions and one to get a new Instance of the FileWriter associated with a given FileExtension. If a new FileWriter is added to PaVoS, this class needs some changed to be able to return the new FileWriter.

Declaration

```
public class FileTypesUtility
extends java.lang.Object
```

Constructor summary

FileTypesUtility() Default constructor

Method summary

getAllPossibleFileExtensions() Gives all supported FileExtensions in an ArrayList. getFileWriterForFileExtension(FileExtension) Gives a new Instance of the FileWriter associated with a given FileExtension.

Constructors

• FileTypesUtility

```
public FileTypesUtility()
```

- Description

Default constructor

Methods

 \bullet getAllPossibleFileExtensions

```
public static java.util.Set getAllPossibleFileExtensions()
```

- Description

Gives all supported FileExtensions in an ArrayList.

- **Returns** Is an Array of the possible FileExtensions for an Export.
- $\bullet \ getFileWriterForFileExtension \\$

```
public static FileWriterStrategy getFileWriterForFileExtension(
    FileExtension extension)
```

- Description

Gives a new Instance of the FileWriter associated with a given FileExtension.

- Parameters
 - * extension Is the FileExtension for which a new instance of an Implementation of the FileWriterStrategy is wanted.
- **Returns** Is the instance of the implementation of a FileWriterStrategy.

3.4.10 Class NetCDFWriterStrategy

Implementation of the FileWriterStrategy interface for NetCDF files.

Declaration

```
public class NetCDFWriterStrategy
  extends java.lang.Object implements FileWriterStrategy
```

Constructor summary

NetCDFWriterStrategy() Default constructor

Method summary

saveToFile(KStream, FilePath) Creates a File as specified by the FilePath and saves the Data from the provided KafkaStream into it.

saveToFile(KStream, FilePath) Creates a File as specified by the FilePath and saves the Data from the provided KafkaStream into it.

Constructors

• NetCDFWriterStrategy

```
public NetCDFWriterStrategy()
```

- Description

Default constructor

Methods

• saveToFile

```
public void saveToFile(KStream stream, FilePath path)
```

- Description

Creates a File as specified by the FilePath and saves the Data from the provided Kafka-Stream into it.

- Parameters
 - * stream is the KStream, that should be exported to a File.
 - * path Is the FilePath, where the new File should be created.
- saveToFile

```
public void saveToFile(KStream stream, FilePath path)
```

- Description

Creates a File as specified by the FilePath and saves the Data from the provided Kafka-Stream into it.

- Parameters
 - * stream is the KStream, that should be exported to a File.
 - * path Is the FilePath, where the new File should be created.

3.5 Package Download

Package Contents	Page
Classes	
AlterableDownloadState	55
Verifies for the State of a Download.	
DownloadID	57
Is an Identifier for a specific Download, so that the right file can be fount for	
a requeststed Download.	
DownloadState	57
Verifies for the State of a Download.	

3.5.1 Class AlterableDownloadState

Verifies for the State of a Download. Can also change it.

Declaration

```
public class AlterableDownloadState
extends Download.DownloadState
```

Constructor summary

AlterableDownloadState() Default constructor

Method summary

```
getFilePath() Gives the FilePath associated with this DownloadID.
isFileReadyForDownload() Checks if a File is Ready to be downloaded.
savePersistent() Save the changed Data persistently.
setFilePath(void) Defines the FilePath for the DownloadID.
setFileReadyForDownload() Validate, that the File is ready to be downloaded.
```

Constructors

• AlterableDownloadState

```
public AlterableDownloadState()
```

- Description

Default constructor

Methods

\bullet getFilePath

```
public FilePath getFilePath()
```

- Description

Gives the FilePath associated with this DownloadID.

- **Returns** - The FilePath of the File for the Download.

\bullet is File Ready For Download

```
public boolean isFileReadyForDownload()
```

- Description

Checks if a File is Ready to be downloaded.

- Returns - A boolean whether the file is downloadable or not.

• savePersistent

```
public void savePersistent()
```

- Description

Save the changed Data persistently.

• setFilePath

```
public void setFilePath(void path)
```

- Description

Defines the FilePath for the DownloadID.

- Parameters
 - * path Is the FilePath to be set.

$\bullet \ set File Ready For Download \\$

```
public void setFileReadyForDownload()
```

- Description

Validate, that the File is ready to be downloaded.

Members inherited from class DownloadState

Download.DownloadState (in 3.5.3, page 57)

- public downloadID
- public FilePath getFilePath()
- public boolean isFileReadyForDownload()

3.5.2 Class DownloadID

Is an Identifier for a specific Download, so that the right file can be fount for a requeststed Download.

Declaration

```
public class DownloadID
  extends java.lang.Object
```

Constructor summary

DownloadID() Default constructor

Constructors

• DownloadID

```
public DownloadID()
```

- Description

Default constructor

3.5.3 Class DownloadState

Verifies for the State of a Download.

Declaration

```
public class DownloadState
  extends java.lang.Object
```

All known subclasses

AlterableDownloadState (in 3.5.1, page 55)

Field summary

downloadID Is an Identifier for a specific Download.

Constructor summary

DownloadState() Default constructor

Method summary

```
getFilePath() Gives the FilePath associated with this DownloadID. isFileReadyForDownload() Checks if a File is Ready to be downloaded.
```

Fields

- public DownloadID downloadID
 - Is an Identifier for a specific Download.

Constructors

• DownloadState

```
public DownloadState()
```

- Description

Default constructor

Methods

• getFilePath

```
public FilePath getFilePath()
```

- Description

Gives the FilePath associated with this DownloadID.

- **Returns** The FilePath of the File for the Download.
- \bullet is File Ready For Download

```
public boolean isFileReadyForDownload()
```

- Description

Checks if a File is Ready to be downloaded.

- Returns - A boolean whether the file is downloadable or not.

3.6 Package ExportDownloadCommunication

Package Contents	Page
Classes	
DownloadServlet	59
Servlet to let the WebGUI download a finished Export.	
ExportServlet	60
HttpServlet to get a Dataexport request from the WebGUI.	
FileExtensionServlet	61
Servlet, to let the WebGUI ask for the available FileExtensions for the Ex-	
port.	
$\operatorname{HttpServlet}$	62
Provides an abstract class to be subclassed to create an HTTP servlet sui-	
table for a Web site.	
StatusServlet	63
Servlet to let the WebGIII check if a Download is ready	

3.6.1 Class DownloadServlet

Servlet to let the WebGUI download a finished Export.

Declaration

 $\begin{array}{ll} \textbf{public class} & \textbf{DownloadServlet} \\ \textbf{extends} & \textbf{ExportDownloadCommunication}. \\ \textbf{HttpServlet} \end{array}$

Field summary

downloadID Is an Identifier for a specific Download.

Constructor summary

DownloadServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) Handles a GET request by sending the desired File to the WebGUI.

Fields

- public DownloadID downloadID
 - Is an Identifier for a specific Download.

Constructors

• DownloadServlet

```
public DownloadServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

Handles a GET request by sending the desired File to the WebGUI.

- Parameters
 - * req Is the HttpServletRequest.
 - * res Is the HttpServletResponse.

Members inherited from class HttpServlet

ExportDownloadCommunication. HttpServlet (in 3.6.4, page 62)

ullet public void $doGet(ext{HttpServletRequest req}, ext{ HttpServletResponse res})$

3.6.2 Class ExportServlet

HttpServlet to get a Dataexport request from the WebGUI.

Declaration

```
public class ExportServlet
  extends ExportDownloadCommunication.HttpServlet
```

Field summary

properties Contains the Properties of an Export Request.

Constructor summary

ExportServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) Handles a GET request by starting the export of the desired Data.

Fields

- public ExportProperties properties
 - Contains the Properties of an Export Request.

Constructors

• ExportServlet

```
public ExportServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

Handles a GET request by starting the export of the desired Data. At the same time a DownloadID is sent back to the WebGUI, so that it can check for the File.

- Parameters
 - * req Is the HttpServletRequest.
 - * res Is the HttpServletResponse.

Members inherited from class HttpServlet

ExportDownloadCommunication. HttpServlet (in 3.6.4, page 62)

• public void doGet(HttpServletRequest req, HttpServletResponse res)

3.6.3 Class FileExtensionServlet

Servlet, to let the WebGUI ask for the available FileExtensions for the Export.

Declaration

```
public class FileExtensionServlet
  extends ExportDownloadCommunication.HttpServlet
```

Constructor summary

FileExtensionServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) Handles a GET request by sending Information about the available FileExtensions.

Constructors

• FileExtensionServlet

```
public FileExtensionServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

Handles a GET request by sending Information about the available FileExtensions.

- Parameters
 - * reg Is the HttpServletRequest.
 - * res Is the HttpServletResponse.

Members inherited from class HttpServlet

ExportDownloadCommunication. HttpServlet (in 3.6.4, page 62)

• public void doGet(HttpServletRequest req, HttpServletResponse res)

3.6.4 Class HttpServlet

Provides an abstract class to be subclassed to create an HTTP servlet suitable for a Web site. (javax.servlet.http.HttpServlet)

Declaration

```
public class HttpServlet
  extends java.lang.Object
```

All known subclasses

StatusServlet (in 3.6.5, page 63), FileExtensionServlet (in 3.6.3, page 61), ExportServlet (in 3.6.2, page 60), DownloadServlet (in 3.6.1, page 59)

Constructor summary

```
HttpServlet() Default constructor
```

Method summary

doGet(HttpServletRequest, HttpServletResponse) Called by the server (via the service method) to allow a servlet to handle a GET request.

Constructors

• HttpServlet

```
public HttpServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

Called by the server (via the service method) to allow a servlet to handle a GET request.

- Parameters
 - * req Is the HttpServletRequest.
 - * res Is the HttpServletResponse.

3.6.5 Class StatusServlet

Servlet to let the WebGUI check if a Download is ready.

Declaration

```
public class StatusServlet
  extends ExportDownloadCommunication.HttpServlet
```

Field summary

downloadID Is an Identifier for a specific Download.

Constructor summary

StatusServlet() Default constructor

Method summary

doGet(HttpServletRequest, HttpServletResponse) Handles a GET request by checking the availability of the desired download.

Fields

- public DownloadID downloadID
 - Is an Identifier for a specific Download.

Constructors

• StatusServlet

```
public StatusServlet()
```

- Description

Default constructor

Methods

• doGet

```
public void doGet(HttpServletRequest req, HttpServletResponse res)
```

- Description

Handles a GET request by checking the availability of the desired download.

- Parameters
 - * req Is the HttpServletRequest.
 - * res Is the HttpServletResponse.

Members inherited from class HttpServlet

 ${\tt ExportDownloadCommunication.HttpServlet} \ \ ({\rm in} \ 3.6.4, \ {\rm page} \ 62)$

ullet public void $doGet(ext{HttpServletRequest req}, ext{ HttpServletResponse res})$
